DEPARTMENT OF WATER RESOURCES

P.O. BOX 388
SACRAMENTO

Honorable Edmund G. Brown, Governor,
and Members of the Legislature of
the State of California

Gentlemen:

The Bulletin No. 130 series of reports incorporates data on surface water, ground water, and climate previously published annually in Bulletins No. 23, 39, 65, 66, and 77. With the inauguration of the new series, publication of the earlier reports is suspended.

Bulletin No. 130 will be published annually in five volumes, each volume to report hydrologic data for one of five specific reporting areas of the State. The area orientation map on page iii delineates these areas. Page ii outlines the organization of the bulletin, its volumes and appendixes.

This report is Volume II, "Northeastern California". It includes a text which summarizes hydrologic conditions in this part of California during the 1963 water year (October 1, 1962 through September 30, 1963) and two appendixes of detailed hydrologic data: Appendix A, "Climate", and Appendix B, "Surface Water Flow". Appendixes C, D, and E will be published separately.

The collection and publication of data such as is contained in Bulletin No. 130 is authorized by Sections 225, 226, 229, 230, 232, 345, 12609, and 12616 of the Water Code of the State of California.

The basic data programs of the Department of Water Resources have been designed to supplement the activities of other agencies, in order to satisfy specific needs of this State. Bulletin No. 130 is designed to present useful, comprehensive, accurate, timely hydrologic data to the public.

Collection of much of the data presented has been possible only because of the generous assistance of other agencies. I wish especially to acknowledge the help given by agencies whose measurements directly contributed to Bulletin No. 130-63. They are the United States Bureau of Reclamation, Corps of Engineers, Geological Survey, Forest Service, Weather Bureau, Air Force, and Army. They include the Departments of Pomology and Irrigation of the University of California at Davis. They are the California Divisions of Beaches

and Parks, Forestry, and Highways, and the California Department of Fish and Game. And they are the Sacramento County Engineer, the Tehama County Flood Control and Water Conservation District, the Pacific Gas and Electric Company, the East Bay Municipal Utility District, and the Sacramento Municipal Utility District.

Without the data supplied by these people, Bulletin No. 130-63 should have been much less the valuable tool it is today.

Sincerely yours,

A handwritten signature in dark ink, appearing to read "W. J. Shaw", is written over the typed name "Director". The signature is fluid and cursive.

Director

CHAPTER I. STATEWIDE HYDROLOGIC CONDITIONS CALIFORNIA 1962-63

California is an area that is unique in many respects. Its climate has always been exceptional and the range of land forms within the State sets it apart from neighboring areas. California has often been described as being set apart, isolated so to speak, by features that prevail over wide areas adjoining the State. Perhaps it would be more appropriate to consider the State as a link between dissimilar regions rather than isolated by them. California does, in fact, span all the dissimilarities of climate and topography from the arid plateaus of the Great Basin to the marshy tidelands of the Pacific and from the rain forests of the Pacific northwest to the parched plains of the Sonoran Desert.

California climate is fostered by a balance between the slow forces of geology and turbulent storms born of the Pacific Ocean. The massive walls of the Rocky Mountains and the Sierra Nevada protect the State from all but a few thrusts of the dry, cold, polar continental air masses. Maritime air masses, originating far out in the Pacific, receive some impetus and direction from wind patterns of the troposphere and move toward the California coast. California lies in a transition zone between the prevailing westerlies that blow across the north Pacific and a calm high pressure zone, the horse latitudes, in the vicinity of 30 degrees north latitude. The horse latitudes, just south of California, buffer the State from many tropical storms which originate further to the south so that the north coast of California is crossed by

more storms than the south coast. The Sierra Nevada and Cascade Mountains, the eastern border of the great central valley, receive much of their precipitation by orographic lifting of the maritime air masses. Interior lands of Southern California are shielded from maritime air masses by the transverse mountain systems and the southerly extension of the coastal ranges. The water year from October 1, 1962 through September 30, 1963, illustrates the extreme variability of weather conditions that occur in the State.

Average values summing up annual conditions for the whole State show the 1962-63 water year to have been about normal. A closer look at this apparent normality shows a series of extreme conditions which in combination resulted in nearly normal averaged values. Figure 1, showing water year precipitation in percent of normal, indicates that normal annual precipitation amounts were recorded in the latitude of San Luis Obispo and Bakersfield. Recorded annual precipitation south of that latitude ranged to less than 50 percent of normal in the vicinity of San Diego and north of the latitude ranged to greater than 150 percent of normal in the mountains along the northern boundary of the State.

During 1962-63, even these annual precipitation values were composed of extremes. In mid-October a series of storm waves drenched northern California, Oregon, and Washington. Rivers in northern California were at near flood level; and Feather River at Oroville reached the highest October stage of record, inundating construction work at the Oroville Dam site. Southern California stayed dry. A mid-winter drought followed,

setting new records for lack of precipitation and for continuous days of fog in the central valley. Again, Southern California was dry.

The drought was broken by a three day downpour at the end of January. Again, flood conditions prevailed in Northern California and some areas, particularly in the upper Yuba River Basin, suffered from serious floods. Much of Southern California received moderate amounts of rain at this time.

During April, Northern California was covered by a series of storms; precipitation was moderate but continued for almost two weeks. The April rains, along with record late season snowfall during May, largely in the northern Sierras, built up snowpacks and assured a normal water supply during the summer. Southern California gained some precipitation but had a less than normal wet season which extended the dry trend that has prevailed in the southern part of the State since 1941.

Understandably other hydrologic features showed abnormal responses. Streamflows alternated between extreme highs and extreme lows but were about normal during the summer. With the recurring threat of floods, operation of reservoirs was difficult, yet the amount of water stored in reservoirs at the end of the water year was greater than year end storage during most of the preceding years. Still, a greater than usual proportion of winter rain flowed directly to the ocean. In Southern California both surface runoff and reservoir storage were below normal.

Ground water conditions followed the pattern of precipitation. In the northern part of the State, ground water basins

generally increased the amount of water in storage. Due to the distribution of the precipitation, increase of stored ground water was less than it should have been. Throughout the southern district precipitation was well below normal and ground water levels continued to drop.

The 1962-63 season in California was unusual, a condition that is routine for the exceptional climate of the State. The northern part of the State was deluged while the southern area continued dry. In general, hydrologic conditions were about normal for the year except that ground water levels in Southern California continued to decline.

NORTHEASTERN CALIFORNIA HYDROLOGIC CONDITIONS 1962-63

Northeastern California includes the Sacramento River Basin, the Sacramento-San Joaquin Delta above Collinsville, the northern portion of the Lahontan Region, and the northern portion of the San Joaquin River Basin.

Each of the hydrologic factors covered in this bulletin (climate, surface water, ground water, surface water quality, and ground water quality) are summarized in the following sections.

CLIMATE

Rainfall totals averaged well above normal during the 1962-63 season. The distribution of precipitation during the season, however, was quite erratic. There were two periods of unusually heavy precipitation. The first of these was during October 10-14, 1962, when there occurred the greatest storm ever recorded in northern California in terms of depth of precipitation over a large area. This great storm of October 1962 was centered primarily in the Feather River Basin. It was followed by a period of relatively dry weather which was broken by another high intensity storm near the end of January 1963. On April 1, 1963, the seasonal precipitation was slightly above normal but the snowpack accumulation in the Sierra watersheds averaged only about 30 percent of normal for that date. This subnormal condition was remedied by the cool, steady rains of April and the unseasonal heavy amounts of precipitation in the high elevations in May and June.

In the valley floor areas the following amounts of precipitation and related percentages of normal rainfall were observed during the 1962-63 season:

Station	1962-63 Season	% of Normal
Stockton	19.46 inches	136%
Sacramento	22.28 inches	124%
Davis	27.10 inches	165%
Marysville	27.80 inches	135%
Chico	34.20 inches	131%
Redding	41.38 inches	107%

Corresponding figures for stations in the higher elevations are as follows:

Station	1962-63 Season	% of Normal
Lakeport	34.68 inches	122%
McCloud	63.53 inches	126%
Alturas	17.34 inches	135%
Susanville	24.99 inches	173%
Tahoe City	45.14 inches	146%
Auburn	44.72 inches	127%

At Sacramento the average temperature for the 1962-63 season was 60.5 degrees which is 1.3 degrees below the average annual normal. The average monthly temperatures varied from 6.6 degrees above normal in February 1963 to 6.7 degrees below normal in April. At Redding the average for the season was 1.1 degrees above normal at 64.3 and varied from 7.4 degrees above normal in February to 5.9 degrees below in April. At the Tahoe City station variations from 10.4 degrees above normal in February to 5.8 degrees below in April contributed to an average for the season of 44.1 degrees which was 1.5 degrees above the average annual normal.

Of particular interest during the season was that the average monthly temperature at each of the above three stations was

higher during February than the average during the months of November, December, January, March and April. Numerous stations in the Sacramento Valley reported this to be the warmest February in the records.

SURFACE WATER

The total runoff for the 1962-63 season greatly exceeded the normal for all river basins in the Northeastern California area. This above normal runoff was mostly concentrated in two short periods, October 1962 and January-February 1963, at which time heavy precipitation occurred. Excepting for these two periods, the runoff for the rest of the year was somewhat below normal.

The October storm produced record runoff for that month in most river basins with the greatest concentration in the Feather River Basin.

As a result of the above-normal runoff, reservoir levels for all reported reservoirs were above normal, with Lake Berryessa being the highest, at 150 percent of normal.

Diversions for April, May and June were somewhat below normal for these months, due to the above-normal precipitation.

GROUND WATER

There are 38 ground water measurement subareas in the Northeastern California area. In the ground water areas covered in the northern Central Valley Region, from the spring of 1962 to the spring of 1963, the average ground water level rose in 15 areas and declined in 17 areas. The greatest average rise was 6.0 feet

(in Solano County) while the greatest average decline was 4.6 feet (in High Valley). In the four ground water basins in the Northern Lahontan Region, from the spring of 1962 to the spring of 1963, the ground water level rose in all basins. The greatest average rise was 4.0 feet, in Surprise Valley. The average changes in ground water levels from the spring of 1962 to the spring of 1963 and the maximum and minimum measured depth in each basin are presented in Tables 1 and 3 of Appendix C.

In the major pumping depressions, the ground water level continued to decline, although the rate of decline was slowed during the period of this report. These depressions are located south of Yuba City in Sutter County, northwest of Wheatland in Yuba County, south of Pleasant Grove in Sutter and Placer Counties, west of Elk Grove and west of Galt in Sacramento County, and in the vicinity of Stockton in San Joaquin County.

In the only other major pumping depression, located east of Dixon in Solano County, the ground water level rose between 2 to 3 feet and the western slope of the depression moved slightly eastward, causing the depression to close.

SURFACE WATER QUALITY

Mineral quality of monitored streams and lakes within northeastern California has generally been excellent during the 1962-63 water year. Almost all surface waters were suitable for most beneficial uses with the only exceptions occurring in Lake and western Yolo Counties and certain channels of the Sacramento-San Joaquin Delta.

The trend established over the years of record at the monitoring stations continued, with most constituents falling within the maximum and minimum values of record.

In Lake and western Yolo Counties high boron concentrations frequently caused the waters to be Class 2 and occasionally Class 3 for irrigation use. Class 2 water is classified as good to injurious and Class 3 is injurious to unsatisfactory. Geologic faulting and past volcanic activity are believed to be the cause of boron in the highly mineralized springs in the Clear Lake area.

Channels in the western periphery of the Delta displayed poor quality during periods of low inflow. This change in quality is due in part to sea water incursion and due in part to percolation caused by the high water table and poor quality ground waters known to exist in the area. These conditions have resulted in an increase in mineral concentrations, degrading the waters to Class 2 and occasionally Class 3 for irrigation use. However, during the irrigation season a definite improvement in water quality is noted in most waterways of the delta. This improvement is due to increased releases from Shasta D.m and operation of the Delta Mendota Pumping Plant.

GROUND WATER QUALITY

Variations in water quality were observed in most basins. However, the changes were confined to small areas and individual wells and do not appear to reflect an over-all change in ground water quality conditions.

Ground water basins located in the Sierra-Nevada Mountain

Range within northeastern California are generally of excellent mineral quality and suitable for most beneficial uses. Ground waters in Sierra Valley displayed a wide variation in mineral qualities. Around the periphery of the valley the water is usually of excellent to good mineral quality, while waters of the west central portion of the valley contain high sodium and chloride concentrations. Nitrate values approaching and in excess of 45 parts per million have been observed in several wells in the area. The United States Public Health Service Drinking Water Standards list 45 ppm of nitrates as a recommended maximum.

Ground waters of Kelseyville and Upper Lake Valleys, located in Lake County, are of good to excellent mineral quality with the exception of some moderately to very hard waters. A few scattered wells in the monitored area displayed high boron concentrations; however, water from these wells is not representative of the water found in the alluvium. These wells are included in the monitoring program because the poor quality waters constitute a threat to the ground water quality in this area.

The other areas covered by the ground water quality monitoring program comprise the Sacramento and Lower San Joaquin Valleys. Water quality problems in these valleys are primarily local and the majority of waters are suitable for most beneficial uses. High concentrations of boron exist in portions of San Joaquin and Yolo Counties, although no significant increases were noted during 1963. High chloride concentrations were found in Stockton and the western portion of San Joaquin County and in the area south of Yuba City in Sutter County. Two wells west of Yuba City have historically contained high concentrations of nitrates (81 ppm and 61 ppm in 1963).

CHAPTER II. SUMMARY OF BASIC DATA PROGRAMS

Table 1 presents a summary of the basic data programs in Northeastern California. The table specifies the origin of the programs, the purpose of the program, the authorization, the type of data collected, the frequency of measurements or service, the collector of data, and the number of different types of stations.

Climatological and surface water stations have been established to supplement the basic networks of the U. S. Weather Bureau and the U. S. Geological Survey. Data from these supplemental stations are included in this bulletin. These data are necessary to provide an accurate inventory of climatological and surface water fluctuations throughout the State. Existing federal stations are insufficient for the task. Efforts are continuously being made to improve the network of stations from which data are collected. Inaccessibility of some mountain areas has deterred the establishment of an adequate climatological network. However, efforts are continually being made to fill the gap. Geologic investigation is accelerating the determination of aquifers from which ground water occurs. In addition the ground water grid is continually being revised. Old wells that have been destroyed are removed from the grid and new ones are added. Investigation to differentiate between shallow and deep ground water zones continues.

Surface water diversions are being measured for hydrologic or water right purposes. The number of diversions has recently been greatly reduced and most of the smaller diversions in the upper Sacramento River are proposed to be eliminated from the measurement program in the near future.

SUMMARY OF BASIC DATA PROGRAMS FOR BULLETIN NO. 130-113 IN NORTHEASTERN CALIFORNIA

Activity	Origin	Purpose	Authorization	Data			
				Type Collected	Collected by	Frequency Measured : Number of or Serviced : Stations	
Surface Water Quality Monitoring	1951	Objectives of this program are: (1) to determine the quality of the State's surface waters; (2) to detect changes in quality and alert control agencies when adverse changes occur; (3) to determine trends; (4) to record and catalogue the data in a readily available form; and (5) to disseminate the data and information gathered.	Sec. 229 of Water Code	Mineral	USGS	Daily composite	4
				Mineral (complete mineral semiannually, partial mineral remaining months)	DWR	Monthly	73
				Partial mineral	USBR	Every other month	16
				Partial mineral	USBR	Monthly	5
				Partial mineral	USBR	Quarterly	3
				Partial mineral	USBR	Irregular	6
				Spectrographic (heavy metals)	DWR	Annually	5
				Radiological	DWR	Semiannually	24
				Organic	DWR	Annually	14
				Bacteriological	DWR	Semiannually	64
Salinity Measurements in the Delta	1945	To determine salinity in the Delta and the effect of varying hydrologic conditions on water quality as related to the USBR operation of the Central Valley Project.	USBR-DWR Contract Agreements Nos. 460171 and 460206	Specific conductance	DWR	Annually	4
				Chloride	DWR	Semiannually	5
					DWR	Monthly	52
					DWR	Every other month	16
Ground Water Quality Monitoring	1953	To compile representative ground water quality data to: (1) establish existing ground water bodies in the State; (2) provide for organization and ready dissemination of ground water quality data.	Sec. 229 of Water Code	Complete and partial mineral	DWR and co-operators (county farm advisors and county health department)	Twice each month	2
				Heavy Metal	DWR	Every four days	27
				Radiological	DWR	Annually	446
					DWR	Selected intervals	45
						Every third year	124

* Samples collected daily and composited at approximately ten-day intervals.

SUMMARY OF BASIC DATA PROGRAMS FOR BULLETIN NO. 130-63 IN NORTHEASTERN CALIFORNIA

Activity	Origin	Purpose	Authorization	Data			
				Type Collected	Collected by	Frequency Measured : Number of or Serviced : Stations	
Climate	1956	To supplement records compiled by the Weather Bureau and to index and file all available data for ready use.	Secs. 228, 12616 of Water Code	Precipitation	Cooperators	Daily	326
				Precipitation	USWB	Daily	233
				Storage Gages	DWR	Annually	32
				Storage Gages	USWB	Annually	14
				Temperature	Cooperators	Daily	141
Surface Water Flow	1924	To provide an inventory of data on surface water which will be available now and in the future for: (1) forecasting streamflow; (2) planning water development projects; (3) operation of flood control and multiple purpose projects; (4) studying tidal action; and (5) formulation of agreement on water rights without expensive litigation.	Secs. 225, 226 of Water Code	1. Streamflow	DWR	1. Serviced twice each month, measured monthly	103
				2. Diversions	DWR	2. Visited monthly, measured semiannually	965
				3. Tidal Stage	DWR	3. Serviced twice each month	37
				4. Drains	DWR	4. Serviced monthly, measured quarterly	11
				5. Stage	DWR	5. Serviced twice each month	21
Ground Water Measurement	1929	To compile representative ground water data, so that: (1) information will be available for future constructive operation; (2) appraisal can be made of drainage and overdraft problems; (3) local interest and cooperation will be stimulated; and (4) planning to develop the potential ground water basins can be facilitated.	Secs. 225, 226, 228, 12622 of Water Code	Depth to Ground Water	DWR, USBR and co-operators, most of whom are county farm advisors	Key wells measured once a month	267 monthly wells, of which DWR measured 197
						Grid wells measured in spring and fall	1900 grid wells, of which DWR measured 335

CHAPTER I. INTRODUCTION

Precipitation is the only significant source of water supply. All runoff and ground water sources derive their waters ultimately from meteorological sources. Planning for more intense development of our available water resources brings to sharp focus the disposition of precipitation. These studies depend on a solution of the hydrologic equation in which the total water supply as precipitation is equal to total water loss in the forms of surface runoff, consumptive use, percolation to the ground water body, etc.

At several times during the history of California attempts were made to collect all available weather records. The collection of weather data by the State of California dates from the early 1850's when tables were published in the transactions of the California State Agricultural Society. These tables grew to be quite extensive. By 1890 a monthly publication called "Bulletin of the California Weather Service" began to list large amounts of climatological data. This monthly report published by a state agency in 1897 developed into the monthly weather and crop bulletin which is now called "Climatological Data" by the U. S. Weather Bureau. This report grew in scope very slowly until about 1940 when the Corps of Engineers financed the addition of about 350 recording rain gages to the network.

The first summary of all weather records was prepared in 1884 under the guidance of William Ham Hall, the first State Engineer. Further summaries were published by the War Department

in 1890 in a House Executive Document, by the Department of Water Resources in the 1920's, by the U. S. Weather Bureau Bulletin, and by the Department of Water Resources Bulletin No. 1 in 1951. Bulletin No.130-63, of which this report is a part, is the first publication that tabulates climatological data on a statewide basis since publication of Bulletin No. 1.

For many years it has been apparent that the official network of the Weather Bureau was not adequate to supply all of the department's needs for climatological data required for water resources investigations. One of the primary objectives of this data program is to supplement the observation network of the U. S. Weather Bureau.

There are 19 cooperating agencies and 271 individuals contributing data contained in this report. Many of the people have been observers for years, and some individuals have over 40 years of weather records which they have made available to the department.

Scope of Report

The area covered in this report together with the station locations are shown on Plate A-1. This report presents a summary of basic precipitation, temperature and evaporation data from July 1, 1962, to June 30, 1963. All of the data presented here are in a monthly form, except the seasonal storage precipitation gage values which are observed only at yearly intervals. More detailed daily and hourly data are available in the department's files.

All records of precipitation and evaporation of which we have knowledge are summarized in this report. All of the monthly precipitation records from the U. S. Weather Bureau are included in this report, since the Bureau has discontinued publishing a summary of their records on a monthly and seasonal basis. Most of the rain data need is for records summarized in this form. The evaporation records are included in this report to complete the tabulation of all of the evaporation records available to the department.

The temperature data presented here supplements "Climatological Data" which is published by the U. S. Weather Bureau. Records from many types of thermometers using different exposure methods and observation techniques are included. The results of these supplementary temperature records are believed to be within a degree of standard weather bureau type stations. With a great diversity of topography and correspondingly large differences in temperature existing in the report area, and with these relatively small differences due to record quality, it was decided to include a good areal coverage rather than exclude some stations from this report.

Measurement Techniques

One of the long term objectives in this program is to document the location, equipment, and methods of observation in use at all of the weather stations. Many of the records which are included in this summary resulted from the curiosity of

farmers, hobbyists and others who have made records for their own use. Wherever possible we are trying to encourage observers to use the methods which are prescribed by the U. S. Weather Bureau.

Numbering Systems

The numbering system used by the department was developed to facilitate station identification by data processing machines. Station numbers are composed from three components - the drainage basin number, the alpha order number and the subnumber.

Drainage Basin Designation

The State was divided into major hydrographic areas, and each of these areas was assigned an alphabetical letter which is the first digit of the drainage basin number. The second digit was obtained by dividing the major hydrographic areas into stream basins of primary importance and assigning a number of 0-9 with 0 generally being the valley floor.

The major hydrographic areas and the stream basins which are reported in this volume are as follows:

Hydrographic Area A

A0 - Sacramento Valley Floor	A5 - Feather River
A1 - Pit River	A6 - Yuba-Bear Rivers
A2 - Shasta Lake	A7 - American River
A3 - Sacramento Valley West Side	A8 - Cache Creek
A4 - Sacramento Valley Northeast	A9 - Putah Creek

Hydrographic Area B

B0 - San Joaquin Valley Floor	B8 - San Joaquin Valley West Side
B1 - Cosumnes River	B9 - Sacramento-San Joaquin Delta
B2 - Mokelumne-Calaveras Rivers	

Hydrographic Area G

G1 - Surprise Valley
G2 - Madeline Plains
G3 - Eagle Lake
G4 - Susan River
G5 - Smoke River

G6 - Herlong
G7 - Truckee River
G8 - Carson River
G9 - Walker River

Alpha Order Number and Subnumber

The four digit alpha order numbers are assigned each station to denote its order in alphabetical sequence, mainly for machine processing. As the collection of data progressed, it was found necessary to add a subnumber of two digits to the four digit alpha number to maintain the alphabetical order of all station names.

CHAPTER II - CLIMATIC CONDITIONS FOR THE 1962-63 SEASON

Within the area covered by this report there were 605 precipitation gage records during 1962-63 including 233 operated for the U. S. Weather Bureau. All of the monthly precipitation totals are summarized on Table 1, and the records for 47 seasonal storage precipitation gages are shown on Table 2.

Temperature measurements were made at 225 locations during 1962-63. There are records for 141 of these stations summarized on Table 3 and the remaining 84 records are published by the Weather Bureau.

There are observed values for 45 evaporation stations shown on Table 4. The records for 16 of these stations are also available in Weather Bureau publications.

Tables 5 and 6 list some of the record breaking precipitation data totals at certain selected stations for the storms of October 10-14, 1962, and January 29 - February 1, 1963, compared with the maximum of record.

All of the climatological stations for which data are included in this report are alphabetically tabulated on Table 7 with their identification number, location, elevation, period of record and cooperator number.

Stockton FSL	Jan 29-Feb 1, 1963	3.20	4.30	5.10	5.11	96
	Maximum of Record	3.13	3.78	4.49	4.70	
NOKELUMBE-CALAVERAS RIVERS DRAINAGE BASIN						
Salt Springs PH	Jan 29-Feb 1, 1963	5.39	10.56	14.90	15.25	35
	Maximum of Record	6.18	10.29	13.76	14.02	
TRUCKEE RIVER DRAINAGE BASIN						
Boca	Jan 29-Feb 1, 1963	2.98	5.23	6.42	6.70	27
	Maximum of Record	2.30	5.05	6.62	6.78	
Tahoe City	Jan 29-Feb 1, 1963	5.30	8.42	11.33	12.15	54
	Maximum of Record	5.04	7.20	11.32	12.03	
Truckee RS	Jan 29-Feb 1, 1963	5.21	7.32	9.36	9.93	72
	Maximum of Record	4.15	7.01	11.49	11.76	

TABLE 7
INDEX OF CLIMATOLOGICAL STATIONS FOR 1962-63

Explanation of the Headings and Symbols
Used in the Columns of the Table

Station Number - Refer to the explanation in Chapter I
of the text on "Numbering Systems."

Station Name, Elevation, Section, Township and Range - These
items are self-explanatory.

40-Acre Tract - This denotes the location of the station
within the section in which it is located. The letter
code is derived from this diagram:

D	C	B	A
E	F	G	H
M	L	K	J
N	P	Q	R

Note that the letters "I" and "O" are not used to
avoid confusion with like numbers.

Base and Meridian - The code for this column is as follows:

M - Mount Diablo Base and Meridian

Latitude and Longitude - The location of the station is
given in degrees, minutes and seconds.

Cooperator Number - This number is assigned from the following list:

000 - Private Cooperators

001 to 399 - Private Agencies

003 - Pacific Gas and Electric Company

400 to 799 - Counties and Municipalities

412 - East Bay Municipal Utility District

419 - Tehama County Flood Control and
Water Conservation District

422 - Sacramento County

430 - Sacramento Municipal Utility District

800 to 899 - State

801 - Pomology Department, U.C., Davis

802 - Irrigation Department, U.C., Davis

804 - State Department of Beaches and Parks

805 - State Department of Fish and Game

806 - Department of Water Resources

808 - Division of Forestry

809 - Division of Highways

900 to 999 - Federal

900 - U. S. Weather Bureau

902 - U. S. Air Force

903 - Corps of Engineers

905 - U. S. Forest Service

907 - State Climatologist (unpublished U.S.W.B.)

911 - Military Weather Stations in California

Cooperator's Index Number - This is the index number assigned to the station by the agency responsible for or handling the records of the station. The U. S. Weather Bureau number is only shown in this column when it differs from the alpha order number.

Record Began, Record Ended - This is the year the record began or ended. If the record continues, or if the beginning or ending year is not known, the column is blank.

Years Missing - This denotes the missing records to the nearest full year and does not include missing records of short duration.

County Code - This is a standard machine processing code for California Counties and adjacent areas as shown below:

Alpine	02	Mono	26	Solano	48
Amador	03	Napa	28	Stanislaus	50
Butte	04	Nevada	29	Sutter	51
Calaveras	05	Placer	31	Tehama	52
Colusa	06	Plumas	32	Yolo	57
El Dorado	09	Sacramento	34	Yuba	58
Glenn	11	San Joaquin	39	State of Oregon	61
Lake	17	Shasta	45	State of Nevada	62
Lassen	18	Sierra	46		
Modoc	25	Siskiyou	47

INTRODUCTION

The Department of Water Resources is concerned with gathering basic data relating to water supply and utilization. In addition to the collection of data on operational water supply, the department is actively engaged in the collection of hydrologic water supply data to augment the base network of the United States Geological Survey. The work consists of field measurements, observations, and office computations to determine quantities of streamflow and diversions. In addition, daily mean gage heights and crests are determined for certain stations, and for tidal stations in the Sacramento-San Joaquin Delta, maximum and minimum stages are determined.

The field activities include the construction and maintenance of streamflow gaging stations, the measurements of (1) flow in streams and drainage channels, (2) the amounts of water returned to natural channels through drainage plants or gravity drains, and (3) the amounts of water diverted for use by each water user.

Much of the office work is comprised of the preparation of hydrographic data for computation by machine methods. This work consists of developing a rating curve for each streamflow station from a series of instantaneous discharge measurements, and relating a formula to the curve. The formula is used by the computer to compute the streamflow quantities.

The office work also includes the manual computation and compilation of the discharge of certain rivers and streams which are not readily computable by an electronic computer.

Where a direct stage-discharge relationship does not exist the discharges are not readily amenable to machine computation. Such a lack of direct relationship may occur when ice forms on the control, or when there is backwater from a tributary or a control structure downstream.

Quantities of water diverted for use are also computed as a regular part of the office work. The quantities computed are total monthly acre-feet. The acre-foot quantities for most diversion points are computed from pumping plant efficiency curves which are developed from a series of instantaneous discharge measurements. The electric power input, the pumping head, and the discharge are recorded simultaneously to compute the efficiency of a pumping plant. This recording of pumping data is done as part of the field work previously mentioned. The office work involved required the development of the efficiency curves and the computation of the monthly acre-feet by using the monthly electric power input records.

Definitions of Terms

Terms used herein are defined as follows:

Second-foot or cubic foot per second is the unit rate of discharge of water. It is a cubic foot of water passing a given point in one second.

Acre-foot is the quantity of water required to cover one acre to a depth of one foot. It is equivalent to 43,560 cubic feet or 325,850 gallons.

Drainage area of a stream at a specific location is that area, enclosed by a topographic divide, into which all

surface runoff will drain by gravity into the stream above the specified point.

Unimpaired runoff is the flow that would occur naturally at a point in a stream if there were: (1) no upstream controls such as dams and reservoirs; (2) no artificial diversions or accretions; and (3) no changes in ground water storage resulting from development. Unimpaired flow is computed from measured runoff by allowing for man-made changes in natural conditions.

Water year is the 12-month period from October 1 of any year through September 30 of the subsequent year, and is designated by the calendar year in which it ends.

Consumptive use is the water transpired, evaporated, and used in promoting vegetative growth plus the water evaporated from adjacent soil and water surfaces.

Scope of Report

This appendix of the hydrologic data report presents surface water data for the Water Year 1963 which is from October 1, 1962 to September 30, 1963, inclusive. The primary data presented herein, consists of stream gaging station descriptions, streamflow quantities, stream stage tables, diversion quantities and reservoir contents.

Tables of streamflow records show the station location, the historic maximum discharge, maximum discharge for the report year, period of record, and datum of gage.

Quantities of daily mean discharge for most stations shown herein were computed by an electronic computer. Gage height data are extracted from standard recorder charts by a

semi-automatic reading machine and put into machine language. The gage height data and rating data are fed into the computer simultaneously, from which daily mean discharges, total monthly acre-feet, and instantaneous maximum and minimum discharges are computed. Those gaging stations presented herein, which are affected by a backwater condition, are not adaptable to computation by machine, hence are computed manually.

Daily mean stage tables of regular streams, and daily maximum and minimum stage of tide affected streams are shown herein. Most of these daily mean gage heights are computed by electronic computer, mentioned above. Generally the gage height data are to the nearest one-hundredth of a foot, and the major crests for the year are shown.

Quantities of water diverted for use are shown as are the names of the water users. The diversion quantities are shown as monthly total acre-feet and total acre-feet diverted for a stream or certain reach of a stream. Starting with this report the diversion season coincides with the water year. Previously the diversion season reported was from November through October. Daily reservoir content in thousands of acre-feet are shown herein, for the major Central Valley Project and State reservoirs.

Included in this report are tables of contents of reservoirs, the deliveries from reservoirs and the Contra Costa Canal, and the exportations from Putah Creek and the Sacramento-San Joaquin Delta.

Included in this publication also are the pertinent surface water data formerly included in "Report of Sacramento-

San Joaquin Water Supervision" published from 1924 through 1955; in "Bulletin No. 23, Surface Water Flow" published from 1956 through 1962, and in "Flood Flows and Stages in Sacramento and Northern San Joaquin Valleys," published from 1913 through 1956.

The objective of this appendix of the hydrologic data report is to bring together, in a permanent and usable form, the surface flow data for the 1963 water year, gathered by the Department of Water Resources and cooperating agencies.

Tables

The tables of daily mean discharge and stage herein are presented by the hydrographic region in which they are located. The hydrographic regions are the same as those used by the State Water Pollution Control Board. The regions, pertinent to this report include the Northern Lahontan Region, and that portion of the Central Valley Region which contains the Sacramento-San Joaquin Delta, Sacramento River Basin, and the northern portion of the San Joaquin River Basin.

Runoff Comparisons

The relative magnitude of runoff occurring on any one stream during a given year may be shown as the ratio of the runoff of that year with the average runoff of the stream expressed as a percentage. For this report, the average unimpaired runoff is computed for the 50-year period October 1908 through September 1958. Table 1 presents, for the major streams of the Central Valley area, the 1962-63 monthly unimpaired runoff expressed as a percent of the 50-year average monthly unimpaired runoff. Table 2 shows the unimpaired average annual runoff for the same

same streams and the percentage of the 50-year average unimpaired runoff for each water year from 1922-23 through 1962-63.

Summary of Water Supply and Utilization, Sacramento-San Joaquin Delta

The complexity of waterways, tidal action, seepage, and methods of agricultural water use results in hydrologic problems which preclude normal methods of measuring water supply and water utilization in the Sacramento-San Joaquin Delta.

The correlation of water supply and use for the Delta Service Area, divided into uplands and lowlands, is shown in Table 3. The water supply available to the area is determined from 14 gaging stations, listed under "Water Supply" in the table, and from 42 precipitation stations in the area. "Water Utilization" in the same table, includes agricultural use, evaporation, exports through the Delta-Mendota and Contra Costa Canals, and diversion for the City of Vallejo. Agricultural use in the uplands is determined by direct measurement of diversions; however, in the lowlands, because it cannot be measured directly, agricultural use is computed by unit values of consumptive use of the various crops, multiplied by the acreages. Unit values of consumptive use were derived from experimental work by the University of California and California Extension Service as reported in Bulletin No. 27 "Variations and Control of Salinity in Sacramento-San Joaquin Delta and Upper San Francisco Bays." Crop acreages are determined by periodic land use surveys. Values used in this report were determined from a survey made in 1960 and 1961.

Daily Mean Discharge

The streamflow tables are arranged, for each stream or stream system, in downstream order. Stations on a tributary entering between two main stem stations are listed between those stations, and in downstream order on that tributary. A stream gaging station is named from the stream and the nearest post office (Feather River at Yuba City) or well-known landmark (San Joaquin River at Brandt Bridge).

Each stream gaging station has a stage-discharge relationship or rating developed. The rating gives the flow in second-feet for each gage height at the station. When flows at a single station occur in excess of 140 percent of the highest measurement on the rating, the computed daily mean discharges are shown as estimated. Normally, the rating is fairly permanent where there is a fixed channel and a fixed flow regimen at the station. The rating varies, however, where the bed of the channel is of loose shifting sand, or where aquatic growth builds up in the channel, changing the flow regimen.

Where the rating is not permanent and varies periodically, more frequent measurements of discharge are necessary to accurately determine the daily mean discharge.

An automatic water stage recorder is in operation at most of the gaging stations used in this work. The continuous records of water surface elevations at the stations serve three major purposes. First, the water surface elevation (gage height) is a factor in determining the flow of the stream passing the station. Second, the actual surface elevations at two adjacent stations on a stream afford the means of obtaining the water

surface elevations at the pumping plants along the stream between those stations. Third, the gage heights are used to determine flood crests. These elevations are used to determine the pumping heads, which in turn become factors in determining the rates of diversion or drainage by pumping plants.

All streamflow data reported herein are derived through the use of mechanical, arithmetical, and empirical operations and methods. Since the results are affected by inherent inaccuracies in the procedures and equipment used, it becomes necessary to establish limits of accuracy for which the data are reported. The following is a listing of significant figures used in reporting streamflow data:

1. Daily flows - second-feet

0.0	- 9.9	Tenths
10	- 99	2 significant figures
100	- up	3 significant figures

2. Means - second-feet

0.0	- 99.9	Tenths
100	- 999	3 significant figures
1000	- above	4 significant figures

The water year totals are reported to a maximum of four significant figures.

Daily Mean Gage Heights

Tables of daily mean gage height and crest stages were published prior to 1957 in a report by the department, entitled "Flood Flows and Stages in Sacramento and Northern San Joaquin Valleys."

Two types of daily data are presented for the height or stage of water surface: (1) for streams subject to tidal influences, daily maximum and minimum gage heights; and (2) for

those streams beyond tidal influence, daily mean gage height, or an average of one or more daily staff gage or wire-weight gage readings. Major river crests for the water year are shown at the bottom of the stage tables and the maximum crests are shown for stations where continuous recorders are in operation.

Gage heights for stage tables are read in the field or computed from recorder charts, and may be reported to either the nearest tenth of a foot or one-hundredth of a foot.

The elevation of the water surface at the gaging station is obtained by adding the gage height readings to the elevation of the gage datum presented in the station history descriptions.

Lakes and Reservoirs

Two types of data are presented for lakes and reservoirs: (1) daily content in acre-feet for Frenchman Reservoir and for Shasta, Folsom, and Berryessa Lakes; and (2) mean inflow in second-feet for Folsom and Shasta Lakes. Plate B-3 consists of hydrographs of Shasta Lake and Folsom Lake.

Diversions

These tables show the water diverted during the period October 1, 1962 - September 30, 1963. While the major use of water is for agriculture, small amounts that are diverted for municipal and industrial uses are also reported. The amounts of water diverted by pumping were determined by rating the capacity of each diversion pumping plant and collecting data of power usage and hours of operation. The amounts of water diverted by gravity (indicated by "Gravity" in column headed "Number and

Size of Pump") were determined either by calibrating suitable measuring devices or by rating canals. For quantities diverted by gravity and subirrigation from tidal affected streams, consumptive use factors were applied to the irrigated area. The monthly diversion values are reported in acre-feet to three significant figures. The totals for individual water users and stream reaches are reported to four significant figures.

Miscellaneous Measurements

Table B-136 contains tabulations of measurements of streamflow on various streams at locations other than those where continuous recorders are maintained. When the flows as shown here are correlated with flows of nearby streams, an estimate of the runoff can be determined.

Numbering System of Recording Stations

To facilitate station identification each gaging station was assigned a six digit code. The method used in assigning these code numbers is as follows: The State was first divided into major hydrographic areas and each of these areas was assigned an alphabetic letter which is the first symbol of the six part code. The second symbol was obtained by dividing the major hydrographic areas into stream basins of primary importance and assigning a digit from 0-9 with 0 generally being the valley floor. The symbol indicates the stream and/or branch on which the station is located. Where a stream crosses a valley floor the third symbol indicates the river basin from which the stream originates, and the fourth symbol now designates the stream. The last three symbols

designate the relative number of the station on the stream system, except in the valley floor, where the last two symbols indicate the relative number. Station numbers increase numerically proceeding upstream. When a minor tributary enters the stream system the station numbers progress up the minor tributary and then up the main stem.

The first two symbols of this code number are shown, encircled on Plates B-1 and B-2. They signify the following hydrographic areas and basins:

Hydrographic Area A

A0 - Sacramento Valley Floor	A5 - Feather River
A1 - Pit River	A6 - Yuba-Bear Rivers
A2 - Shasta Lake	A7 - American River
A3 - Sacramento Valley West Side	A8 - Cache Creek
A4 - Sacramento Valley Northeast	A9 - Putah Creek

Hydrographic Area B

B0 - San Joaquin Valley Floor	B2 - Mokelumne-Calaveras Rivers
B1 - Cosumnes River	B9 - Sacramento-San Joaquin Delta

Hydrographic Area G

G1 - Surprise Valley	G5 - Smoke River
G2 - Madeline Plains	G6 - Herlong
G3 - Eagle Lake	G7 - Truckee River
G4 - Susan River	G8 - Carson River
	G9 - Walker River

The last four symbols of the code are shown at the recording station locations on Plates B-1 and B-2. All six symbols are indicated on the hydrographic area index, and on the alphabetic index to the streamflow and stage tables, and in the upper right-hand box of the table for each individual gaging station.

Examples.

- * Preliminary data subject to revision.
 ** Average unimpaired runoff in the basin of 31,100 feet computed from the 1947-48 year period (October 1947 through September 1948).
 † Figures were computed from summations of unimpaired runoff at 15 gauging stations on major tributaries only and do not include runoff from minor tributaries and from the valley floor.
 ‡ Formerly listed as "Feather River near Orcuttville." Station located, per report of July 1, 1960, at a site 5.2 miles upstream.

* Average unimpaired runoff in the United States computed from 1900 to 1967 (the average for September 1957).
 ** Preliminary data subject to revision.
 a Figures were computed from summations of unimpaired runoff at 57 gaging stations on major tributaries only and do not include runoff from minor tributaries and from valley floor.
 b Formerly listed as "Feather River near Orville." Station located, prior to July 1, 1962, at a site 2.2 miles upstream.

Water supply from precipitation has been computed using weight assigned monthly average rainfall for the Delta Service Area. Consumption use in the Delta Lowland area has been computed using monthly unit consumption for irrigated vegetation and for other uses. Average intake for the Delta area during 1961.

Station located at county road bridge, 5 mi. W of Alturas. Stage-discharge relationship at times affected by temporary diversion dam approx. 1 mi. below station and also by ice. During periods of backwater affect by dam, flow listed is not considered to have the same accuracy as other records published in this report. Flow is regulated by many small reservoirs.

The figures contained herein are computed inflow to Shasta Lake and take into account change in storage, release, spill, precipitation, and evaporation. They are representative of the natural flow which would pass the damsite (9.5 mi. N of Redding) if the dam had not been constructed. Records furnished by USBR. Drainage area, excluding Goose Lake Basin, is 6,665 sq. mi.

Shasta Lake has a usable capacity of 4,377,000 ac.-ft. between elevations 737.75 and 1,045.0 ft. above mean sea level. Not available for release, 115,700 ac.-ft.

Station located 4.1 mi. E of Colusa, 3.7 mi. N of Meridian. Tributary to Sacramento River. Flow regulated by gravity culverts. These flows, together with flow of Butte Slough at Mawson Bridge and Wadsworth Canal near Sutter are, during the summer months, made up almost entirely of return water from lands irrigated by Feather River diversions.

" - Irrigation season only.

Station located at Knights Landing Outfall Gates, 0.3 mi. W of Knights Landing. Tributary to Sacramento River. Flow regulated by outfall gates. An undetermined amount of flow is diverted to Yolo Bypass via Ridge Cut at Knights Landing. For total flow to Sacramento River, combine with flows of Reclamation District 787 to Colusa Basin Drain. Maximum gage height listed does not indicate maximum discharge.

- Irrigation season only.

Station located at West Butte-Meridian Highway bridge, 3.1 mi. N of Meridian. Tributary to Butte River. Flow affected by gate operation. Flow during summer months is made up almost entirely of return water from lands irrigated by Butte River. During flood periods, Sacramento River water enters Butte Basin above Butte City by tank spill and spill over M. A. N. and C. J. N. levees.

- Flood season only.

Station located on downstream side of South Butte Road Bridge, 0.9 mi. E of Sutter. Tributary to Sutter Bypass. Maximum gage height listed here does not necessarily indicate maximum discharge. This station and one 2.2 mi. downstream are used to determine slope for rating channel. The flow of Butte Slough to Sutter Bypass make up entire Feather River contribution to the Sutter Bypass. Prior records, January 1960 to March 1961, available at a site approximately 0.3 mile upstream.

Station is located .5 mi. above mouth, 4.6 mi. SE of Knights Landing. During low flows this represents combined flows of Sutter Bypass and Irrigation District 1506. During high flows (above gage ht. 29.0⁺) the slough is entirely submerged as it lies within the bypass area. Sharp rises in the Sacramento River cause zero or negative flow.

- An undetermined amount of negative flow.

F - Full.

" - Irrigation flow only.

See Sacramento River at Sacramento Weir for stage record and location. Elevation of fixed crest of weir is 25.0 ft. USED datum; elevation of movable crest (top of needles) is 31.0 ft. USED datum. There are 45 gates, each 38 ft. in length. 45 gates were opened between 2030 and 2350 hours on Feb. 1. These gates were closed between 1350 hour on Feb. 5 and 1600 hour on Feb. 7. Other discharge listed is leakage through the gates.

The figures contained herein are computed inflow to Folsom Reservoir and take into account change in storage, release, spill, precipitation, and evaporation. They are representative of the natural flow which would pass the damsite (2.4 mi. NE of Folsom) if the dam had not been constructed. Records furnished by USBR. Drainage area is 1,575 sq. mi.

Folsom Reservoir has a usable capacity of 1,010,400 ac. ft. between elevations 205.5 and 406.0 ft. above mean sea level, practically all of which is available for release. Spillway design flood pool elevation is 475.4 ft. (capacity 1,120,000 ac. ft.)

Station located at Airport Way bridge, 1.5 mi. E of French Camp. Drying periods when no water.											

Station located at Airport Way bridge, 1.5 mi. E of French Camp. During spring when water from a temporary diversion dam affects the stage-discharge relationship, a supplementary water stage recorder, located 0.5 mi. downstream on the bypass, is used for computations. Triangular to San Joaquin River. Maximum discharge listed at gage height and datum then in use.

Station located 0.2 mi. above Farmington-Bellota Highway bridge, 0.2 mi. E of Bellota. Flow regulated by Hogan Reservoir. During irrigation season, flow is reregulated by boards placed across diversion dam immediately downstream which control division of water between the Calaveras River and Mormon Slough. This is flow from Calaveras River which is returned to the river via Stockton Diverting Canal.

TABLE 136

STREAM FLOW MEASUREMENTS AT MISCELLANEOUS SITES (Contd.)

Measurements of streamflow at points other than gaging stations are at points where flow has not been computed and are listed in the following table.

Station	Tributary	Location	Measurements		
			Date	Gage Height (ft.)	Discharge (cfs)
Yuba River at F.M. 100	Peather River	SW1, Sec. 24, T15N, R1E	5-26-63 7-3-63 7-24-63 5-7-63 6-21-63 9-5-63		1123 492 265 253 224 188
Little River at Clough near T-10000		T1N, R4E	6-18-63 to 6-19-63		2960 (B) 2850 (B)
Little River at Bear Island, East		T1N, R4E	4-25-63 to 4-27-63		702 (B) 704 (B)
Little River at Bear Island, West		T1N, R4E	4-25-63 to 4-26-63		1060 (B) 1320 (B)
Yuba River at Highway 10		T1N, R4E	6-18-63 to 6-19-63		5630 (B) 5720 (B)
Old River at Clinton Coast Ferry		T1S, R4E	4-24-63 to 4-26-63		4300 (B) 4520 (B)
Old River at Wolf		T1S, R4E	3-13-63 to 3-14-63		1230 (B) 1240 (B)
Old River at McLean Hill		T1N, R4E	4-24-63 to 4-24-63		3260 (B) 3130 (B)
Old River at McLean Hill		T1N, R4E	4-25-63 to 4-26-63		2640 (B) 2590 (B)
Old River at McLean Hill		T1S, R4E	3-13-63 to 3-14-63		1620 (B) 1610 (B)

A. Measurements at Clough Flow at Weathered Lake. The flow of South San Joaquin Irrigation District Drain 11 is measured at this point. Gage height shown are at that gaging station.

B. Flow shown are mean daily flow for the period of the measurement. They are obtained by plotting a hydrograph from the measurements made over the four phases of the cycle.

* Diversion from Colusa Basin Drain west of Reclamation District 105 and 757, and then discharges to Sacramento River at Mile 6.11R or partial diversion via Knight Landing Ridge Cut.

** Mileage along Colusa Basin Drain from junction with Sacramento River. This diversion stopped on 10/1/67, due to attack in the diversion program.

b Formerly listed as Le. P. L. W. River.
c Formerly listed as L. L. W. River and F. J. Byington.
d Formerly listed as S. Ash.
e Replaces a 14" unit.
f The 12" unit was a temporary installation during 1963.
g New installation in 1967.
h Includes 5164 acre-feet of spill to Willows Creek as follows: May 1960, June 1977, July 198, August 199, and September 24, 199.

 DIVERSIONS, BUTTER BYPASS AND NAMEVI L

[illegible]

1. The first step is to identify the problem. This involves understanding the current situation and the goals that need to be achieved.
2. The second step is to analyze the problem. This involves breaking down the problem into smaller, more manageable parts and identifying the causes of the problem.
3. The third step is to develop a plan. This involves determining the steps that need to be taken to solve the problem and the resources that will be needed.
4. The fourth step is to implement the plan. This involves putting the plan into action and monitoring progress.
5. The fifth step is to evaluate the results. This involves assessing the effectiveness of the solution and making any necessary adjustments.

- * Hm at Oroville was formerly listed as Hm at Oroville.
- * This Creek enters the Feather River at Oroville.
- * Plant diverts Feather River water to the Oroville Creek.
- * Distance from Feather River and bank is shown in parentheses.
- * Installed prior to 1963. No gravel is listed.
- * No Feather River water was diverted after June, as the river was low at Oroville.
- * Replaced a 1-1 unit.

- * An S unit was installed at Oroville.
- * No installation in 1963.
- * This total includes all water diverted from the Feather River through the Oroville Dam.
- * Monthly totals as follows: October, 31,470; November, 5,400; December, 0; January, 0; February, 0; March, 8,200; April, 6,400; May, 114,500; June, 111; July, 4,250; August, 5,720; September, 0.
- * Replaced gaging station at Oroville.

Station located 2.3 mi. SW of Hamilton City, 6 mi. above mouth. Tributary to Sacramento River. Flow regulated by East Park Reservoir and Stony Gorge Reservoir. Flow to Sacramento River is cut off during irrigation season by an earth fill installed by Glenn-Colusa Irrigation District to transport water from their main canal across Stony Creek. Records furnished by USGS. Drainage area is 764 sq. mi.

Station is located 0.1 mi below highway bridge, 1.7 mi. E of College City. Flow is drainage chiefly from lands irrigated by Glenn-Colusa, Princeton-Colusa-Glenn, Compton-Delevan, and Maxwell, Irrigation Districts. Backwater from Knight's Landing Outfall Gates at this point affects stage-discharge relationship. Maximum gage height listed does not necessarily indicate maximum discharge.

Station located just above the Southern Pacific Railroad bridge, 13.1 mi. above Feather River immediately NE of Knights Landing.											

Station located just above the Southern Pacific Railroad bridge, 13.1 mi. above Feather River immediately NE of Knights Landing.
Station affected by backwater from Feather River and Sutter Bypass during periods of high flow. Maximum discharge of record listed is for period 1940 to date. Records furnished by USGS. Maximum gage height listed does not necessarily indicate maximum discharge.

- Irrigation season only.

Station located at West Butte-Meridian Highway bridge, 3.0 mi. N of Meridian. Tributary to Sutter Bypass. Flow affected by gate operation. Flow during summer months is made up almost entirely of return water from lands irrigated by Feather River diversions. During flood periods, Sacramento River water enters Butte Basin above Butte City by bank spill and spill over Moulton and Colusa Weirs.

- Flood season only.

Station located on downstream side of South Butte Road Bridge, 0.9 mi. E of Sutter. Tributary to Sutter Bypass. Maximum gage height listed does not necessarily indicate maximum discharge. This station and one 2.2 mi. downstream are used to determine slope for rating of canal. Prior records, January 1939 to March 1961, available at a site approximately 0.3 mile upstream.

Station located above spillway of Englebright Dam, 1.0 mi. above Deer Creek, 2.5 mi. NE of Smartville. Flow regulated by Lake Spaulding, Englebright Reservoir, Bowman Lake, Fardyce Lake, and many smaller reservoirs. Maximum discharge listed includes flow through powerhouse. Records furnished by USGS. Drainage area is 1,104 sq. mi.

Station located 1,000 ft. above I Street bridge, 0.5 mi. below the American River. Below approx. 75,000 c.f.s., the stage-discharge relationship is affected by tidal influence. Records furn. by USGS.

Note: During periods of tidal influence, mean gage height listed is mean of four tides. See Table 227 for periods when tidal action is affected by flow.

8 - Irrigation season only

* In order to machine-process the data in this table, it was necessary to avoid negative gage heights. Subtract 10.00 feet to obtain recorder gage height.
A Tidal action affected by flow. Gage heights listed are maximum and minimum stage for day.

* In order to machine process the data in this table, it was necessary to record negative gage heights.
Subtract 10.00 feet to obtain recorder gage height.
A Tidal action affected by flow. Gage heights listed are maximum and minimum stage for day.

Station located 10.7 mi. below Sacramento, 1.9 mi. NW of Freeport. Station affords a tidal gauge.
Maximum gage ht. listed does not necessarily indicate maximum discharge.

* In Event of an Error in the above table, it is to be corrected by the following:
Subtract 0.01 feet from the stage height.
A Tidal gauge is used to determine the maximum and minimum stage height.

Station located at site of Frenchman Dam on Little Lost Chance Creek, 7.1 mi. N. of Chilcoot.

Frenchman Dam was completed in October and storage began in November. The reservoir has a usable capacity of 57,568 acre-feet between elevations 8517' (invert of intake) and 8555' (crest of spillway). Not available for release, 1,875 acre-feet.

Record from Jan. 10 to Mar. 30 utilized periodic staff gage observations to obtain estimates of daily 2400-hour readings. Gage ht. record, from a recorder installed Mar. 30 in the outlet structure, was influenced by temperature variations which sometimes made the 2400-hour readings inaccurate. An analysis of the grain disclosed that, on the average, there was less temperature effect on the readings at the 0100-hour than at any other time. On rising and falling stages, it was not possible to determine the difference between the true stage change and change due to temperature. Elevation data given, for the period Mar. 30 to Sep. 30, is as if the 2400-hour when the water surface is either rising or falling, and as if the 0100-hour when the water surface remains fairly constant.

Station is sited 0.7 mi. below St. Frank American Rd. 1.2 mi. NE of Folsom. Reservoir owned by USBR. Drainage area is 1,175 sq. mi.

Folsom Reservoir has a usable capacity of 1,010,000 cu. ft. between elevations 405.8 and 466.0 ft. and a mean sea level. Practically all of this is available for release. Spillway design flood discharge at 466.0 ft. (capacity 1,320,000 cu. ft.).

Daily content figures given herein, representing usable content, are as of 2400 hours.

Station located near center of Middle Dam on Berryessa Creek, 7.4 mi. W of Winters.
Record furnished by USBR. Drainage area is 577 sq. mi.

Lake Berryessa has a usable capacity of 1,502,000 cu. ft. between elevations 244.25 and 440 ft.
Not available for release is 10,440 cu. ft.

Daily content shown is at 0400 GMT.
